or ichr. The plates remain for some time in the lehrs, where the tempera-ture is gradually reduced. When the plate is taken from the anrears held a foremost place in its man-ufacture. In comparatively modern times, glass making has extended to oth-faces. Only the surface, however, for an industry in the United States early is submitted for careful inspection, and then goes to the cutter who takes off the rough edges and zouares it into the right dimensions; and thence to the grinding

Grinding and Polishing.

The grinding table is a large, flat refive feet or more in diameter. This ta-ble is prepared by being flooded with plaster of paris and water; then the glass planer of paris and water, the the games is carefully lowered, and men mount upon the plate and tramp it into place until it is set. After this, greater security is obtained by pegging with prepared wooden blocks; and the table is set in motion. The grinding is done by revolving runners. fed upon the table, and a stream of wa-ter constantly flows over it. After the first cutting by the sand, emery is used in a similar manner. The plates are in-spected after leaving the grinding room

and if scratches or defects are found they are marked. There are also, not infrequently nicks and fractures found at this stage; and in some cases the plate must again be cut and sounred, or if the defects are too great, the plate is broken up for cullet The polishing is done on another special table by means of special reciprocating machinery, using rouge, (fron peroxide) applied with water, and rubbing the glass the rubbing surface. The srinding and polishing has reduced the original plate itself to half its thickness, sometime more. The material walled away i lost and fully half the original weigh of time and soda has vanished, and excessive defects and reject that which is not up to qualify

Grading and Quality.

New plate is sea-green, looking at the "meral" through the edge, which grad-ually failes when exposed for a period in surlight and weather, to a yellow or the elements upon the chemical consti-

tionis of the glass.

In the fulshed product (glazing quali-ty) there may appear some defects, which in no way impair the value, beauary use, such as small seed or bub-bles, short-finish, reams or surface scratches which are accepted as con-tingent with the regular run of plats, schools of small minious to feed upon. These birds, which are seidom seen so far insind, except at this season of the year, are attracting a great deal of its reducting and treatment of fire-clay and even an open bubble or shot-hold and even an open bubble or shot-hold entering a great deal of its enormous financial investment, a multi-tention from passers by, as they swim on the surface of the water resembling a feet of men, and extensive factory properties. It should be stated that the product
